14 August 2020

Contents

1 Introduction

This is a simple analysis of data around the Novel Coronavirus (COVID-19) in China, to demonstrate data processing and visualisation with R, *tidyverse* and *ggplot2*.

I have also produced a similar report for COVID-19 worldwide. If you are interested, please find it at http://www.rdatamining.com/docs/Coronavirus-data-analysis-world.pdf.

1.1 Data Source

The data sourse used for this analysis is Ding Xiang Yuan[1], which provides the data around the Novel Coronavirus (COVID-19) in China. Specifically, the data was retrieved from the *COVID-19/2019-nCoV Time Series Infection Data Warehouse* repository on GitHub[2]. Detailed descriptions of the data can be found at http://lab.isaaclin.cn/nCoV/en.

The data was collected from 24 January 2020, the second day of Wuhan lockdown.

1.2 R Packages

Blow is a list of R packages used for this analysis. Package *magrittr* is for pipe operations like `%>%` and `%<>%` and *lubridate* is for date operations. Package *tidyverse* is a collection of R packages for data science, including *dplyr* and *tidyr* for data processing and *ggplot2* for graphics. Package *gridExtra* is for arranging multiple grid-based plots on a page and *kableExtra* works together with `kable()` from *knitr* to build complex HTML or LaTeX tables.

```
library(magrittr)
library(lubridate)
library(tidyverse)
library(gridExtra)
library(kableExtra)
```

1.3 Notes

If you want to run the R scripts without using R Markdown, please remove all the `kable` related stuff when printing the data.

2 Loading Data

At first, the dataset, which is a CSV file, is downloaded and saved as a local file, and then it is loaded into R.

```
url <- 'https://raw.githubusercontent.com/BlankerL/DXY-COVID-19-Data/master/csv/DXYOverall.csv'
filename <- './data/DXYOverall.csv'
download.file(url, filename)
data.raw <- read.csv(filename)
# summary(data.raw)
# names(data.raw)
```

The data was last updated at 2020-07-17 02:01:01.

Then we select relevant columns and have a look at the first 30 rows.

```
## select columns
data.raw %<>% select(c(updateTime, curedCount, deadCount,
                       currentConfirmedCount, confirmedCount, suspectedCount,
                       #  seriousCount,
                       curedIncr, deadIncr, confirmedIncr, suspectedIncr
                       # currentConfirmedIncr,
                       # seriousIncr
                       ))
head(data.raw, 30) %>%
  kable('latex', booktabs=T, caption='Raw Data (with Selected Columns Only)') %>%
  kable_styling(font_size=4, latex_options = c('striped', 'hold_position', 'repeat_header'))
```

3 Data Preparation

3.1 Selecting Last Record of Each Day

There are many records with different timestamps for every single day. For this analysis, we focuse on daily numbers and therefore keep only the last record on each day. To acheieve that, we group dataset by date and then select the first record from each group (i.e., from each day).

```
## convert from character to date
data.raw %<>% mutate(date=date(updateTime))
## sort by timestamp
# data.raw %<>% arrange(updateTime)
## select the latest record on each day
data <- tbl_df(data.raw) %>%
    group_by(date) %>%
    top_n(1, updateTime)
## sort by date ascendingly and remove updateTime
data %<>% arrange(date) %>% select(-updateTime)

min.date <- min(data.raw$date)
max.date <- max(data.raw$date)
min.date.txt <- min.date %>% format('%d %B %Y')
max.date.txt <- max.date %>% format('%d %B %Y')
```

3.2 Daily New Cases and Death Rates

After that, the daily increases of death and cured cases and the death rates are calculated.

`rate.upper` is caculated with the total deaths and cured cases. It is the upper bound of death rate and the reasons are

1) there were much more deaths than cured cases when the coronavirus broke out and when it was not contained, and

2) the daily number of death will decrease and that of the cured will increase as it becomes contained and more effective measures and treatments are used.

`rate.lower` is caculated with total deaths and confirmed cases. It is a lower bound of death rate, because there are and will be new deaths from the active confirmed cases. The final death rate is expected to be in between of the above two rates.

`rate.daily` is caculated with the daily deaths and cured cases and therefore is more volatile than the above two. However, it can give us a clue of the current situlation: whether it is very serious or is getting better.

```
## daily new cases
n <- nrow(data)
data %<>% as.data.frame() %>%
  mutate(new.dead = deadCount - lag(deadCount, n=1),
         new.cured = curedCount - lag(curedCount, n=1),
         new.confirmed = confirmedCount - lag(confirmedCount, n=1))

## death rate based on total deaths and cured cases
data %<>% mutate(rate.upper = (100 * deadCount / (deadCount + curedCount)) %>% round(1))
## lower bound: death rate based on total confirmed cases
data %<>% mutate(rate.lower = (100 * deadCount / confirmedCount) %>% round(1))
## death rate based on the number of death/cured on every single day
data %<>% mutate(rate.daily = (100 * new.dead / (new.dead + new.cured)) %>% round(1))
```

3.3 Data Imputation

Some rows of column *currentConfirmedCount* are not populated in the raw dataset and we impute it as below.

```
## impute missing currentConfirmedCount
data %<>% mutate(currentConfirmedCount =
                   ifelse(is.na(currentConfirmedCount),
                          confirmedCount - curedCount - deadCount,
                          currentConfirmedCount))
```

3.4 Data Discrepancy

There is discrepancy in the dataset, which is checked with code below. Please understand that some numbers are not 100% accurate.

```
## check for data discrepancy
data %<>% mutate(total = currentConfirmedCount + curedCount + deadCount)
data %<>% mutate(error.dead = new.dead - deadIncr,
                 error.cured = new.cured - curedIncr,
                 error.total = total - confirmedCount)
data$error.dead %>% summary()
```

```
##      Min.   1st Qu.    Median      Mean   3rd Qu.      Max.      NA's
## -108.0000    0.0000    0.0000   -0.8589    0.0000    1.0000        11
```

```
data$error.cured %>% summary()
```

```
##    Min. 1st Qu.  Median    Mean 3rd Qu.    Max.    NA's
## -569.00  -70.50  -19.00  -80.24   -4.00   31.00      11
```

```
data$error.total %>% summary()
```

```
##    Min. 1st Qu.  Median    Mean 3rd Qu.    Max.
```

```
##       0       0       0       0       0       0
```

```
# head(data %>% as.data.frame())
```

Since today's cured and death counts are subject to change and will not be finalised until end of today, we might want to exclude today's rates and new cases from some plots in next section.

```
# data %<>% arrange(date)
# if(data$date[n] == today()) {
#   data$rate.daily[n] <- NA
#   data$new.dead[n] <- NA
#   data$new.cured[n] <- NA
#   data$new.confirmed[n] <- NA
# }
```

4 Visualisation

After tidying up the data, we visualise it with various charts.

4.1 Number of Cases

Figure 1 shows the number of COVID-19 cases in China. The line and area plots show the numbers of dead, cured, active confirmed and suppected cases. Note that, in the area plot, the total number of confirmed cases is represented by the total areas of confirmed, cured and deaths.

```
# total/active confirmed cases
p <- ggplot(data, aes(x=date)) +
  geom_line(aes(y=suspectedCount, color='Suspected')) +
  geom_line(aes(y=confirmedCount, color='Total Confimed')) +
  geom_line(aes(y=currentConfirmedCount, color='Active Confimed')) +
  geom_line(aes(y=curedCount, color='Cured')) +
  geom_line(aes(y=deadCount, color='Deaths')) +
  xlab('') + ylab('Count') +
  theme(legend.title=element_blank(), axis.text.x = element_text(angle=45, hjust=1)) +
  scale_color_manual(values = c(
    'Suspected' = 'orange',
    'Total Confimed' = 'purple',
    'Active Confimed' = 'red',
    'Cured' = 'green',
    'Deaths' = 'black'))

## draw a plot and add annotations
plot1 <- p + labs(title=paste0('Number of Cases - ', max.date.txt)) +
  annotate('segment', x=ymd('2020-01-27'), xend=ymd('2020-01-24'),
           y=29000, yend=5000, colour='skyblue', size=0.5,
           arrow=arrow(length=unit(0.2, 'cm'))) +
  geom_text(x=ymd('2020-01-28'), y=35000,
            label='Wuhan lockdown\n on 23 Jan',
            color='skyblue', size=1.8) +
  annotate('segment', x=ymd('2020-02-02'), xend=ymd('2020-02-11'),
           y=64000, yend=52000, colour='skyblue', size=0.5,
           arrow=arrow(length=unit(0.2, 'cm'))) +
  geom_text(x=ymd('2020-02-01'), y=75000,
            label='New criteria introduced \n and new Heads of \n Wuhan & Hubei started\n on 13 Feb',
            color='skyblue', size=1.8) +
```

```
  annotate('segment', x=ymd('2020-04-08'), xend=ymd('2020-04-08'),
           y=14000, yend=6000, colour='skyblue', size=0.5,
           arrow=arrow(length=unit(0.2, 'cm'))) +
  geom_text(x=ymd('2020-04-07'), y=20000,
            label='Wuhan unlocked\n on 8 Apr',
            color='skyblue', size=1.8) +
  annotate('segment', x=ymd('2020-04-17'), xend=ymd('2020-04-17'),
           y=29000, yend=7000, colour='skyblue', size=0.5,
           arrow=arrow(length=unit(0.2, 'cm'))) +
  geom_text(x=ymd('2020-04-17'), y=35000,
            label='Death toll rectified\n on 17 Apr',
            color='skyblue', size=1.8)

plot2 <- p +
  labs(title=paste0('Number of Cases (log scale) - ', max.date.txt)) +
  annotate('segment', x=ymd('2020-06-10'), xend=ymd('2020-06-14'),
           y=500, yend=300, colour='skyblue', size=0.5,
           arrow=arrow(length=unit(0.2, 'cm'))) +
  geom_text(aes(x=ymd('2020-05-28'), y=600),
            label='New cases in Beijing\n started on 11 Jun',
            color='skyblue', size=1.8) +
  scale_y_log10()

## convert from wide to long format, for purpose of drawing an area plot
data.long <- data %>% select(c(date, suspectedCount,
                               currentConfirmedCount, curedCount, deadCount)) %>%
  rename(Suspected=suspectedCount, Confimed=currentConfirmedCount,
         Cured=curedCount, Deaths=deadCount) %>%
  gather(key=type, value=count, -date)
## set factor levels to show them in a desirable order
data.long %<>% mutate(type = factor(type, c('Suspected', 'Confimed', 'Cured', 'Deaths')))
## area plot
plot3 <- ggplot(data.long, aes(x=date, y=count, fill=type)) +
  geom_area(alpha=0.5) + xlab('') + ylab('Count') +
  labs(title=paste0('COVID-19 in China - ', max.date.txt)) +
  theme(legend.title=element_blank(), axis.text.x = element_text(angle=45, hjust=1)) +
  scale_fill_manual(values=c('orange', 'red', 'green', 'black'))

## show three plots together
grid.arrange(plot1, plot2, plot3, ncol=1)
```

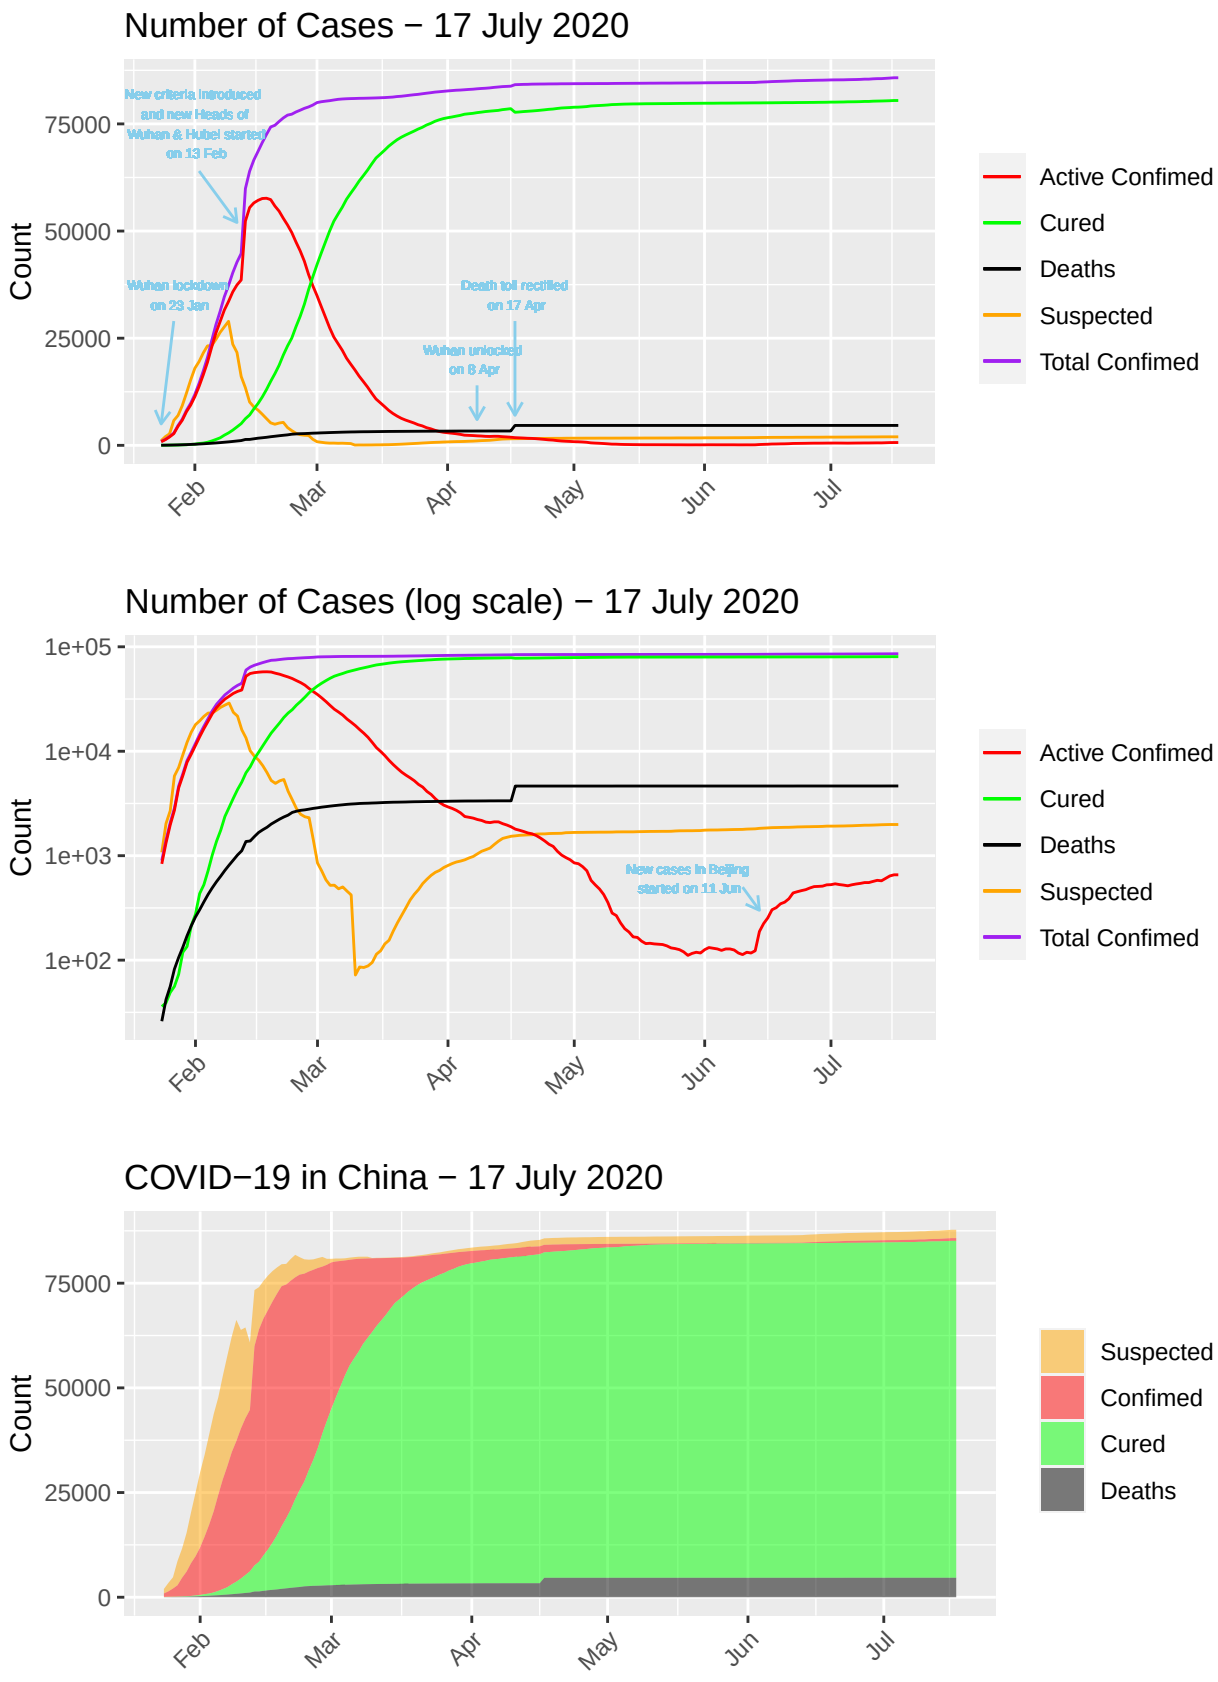

Figure 1: Numbers of COVID-19 Cases

Figure 1 (based on official stats) shows that the coronavirus seems to be contained in China, in that

- there are a lot of recovered cases (in green) every day,
- the remaining confrimed cases (in red) are shrinking significantly,
- suspected cases (in orange) are almost gone, and

However, the second chart above shows that there have been new cases in Beijing starting on 11 June 2020.

4.2 Active Confirmed Cases

In the right chart of Figure 2, there is a big spike of more than 15,000 new confirmed cases on 13 February 2020. The reasons are that Chinese government changed the criteria for confirmed cases and new measures were introduced by a new Head of Hubei Province and a new Head of Wuhan City, who replaced their predecessors on that day.

```
## active confirmed and its increase
plot1 <- ggplot(data, aes(x=date, y=currentConfirmedCount)) +
  geom_point() + geom_smooth() +
  xlab('') + ylab('Count') + labs(title='Active Confirmed Cases') +
  theme(axis.text.x = element_text(angle=45, hjust=1))
plot2 <- ggplot(data, aes(x=date, y=new.confirmed)) +
  geom_point() + geom_smooth() +
  xlab('') + ylab('Count') + labs(title='Daily New Confirmed Cases') +
  theme(axis.text.x = element_text(angle=45, hjust=1)) +
  annotate('segment', x=ymd('2020-03-01'), xend=ymd('2020-02-16'),
           y=14000, yend=14800, colour='skyblue', size=0.5,
           arrow=arrow(length=unit(0.2, 'cm'))) +
  geom_text(x=ymd('2020-03-24'), y=12500,
            label='New criteria introduced \n and new Heads of \n Wuhan & Hubei started\n on 13 Feb',
            color='skyblue', size=2)
grid.arrange(plot1, plot2, ncol=2)
```

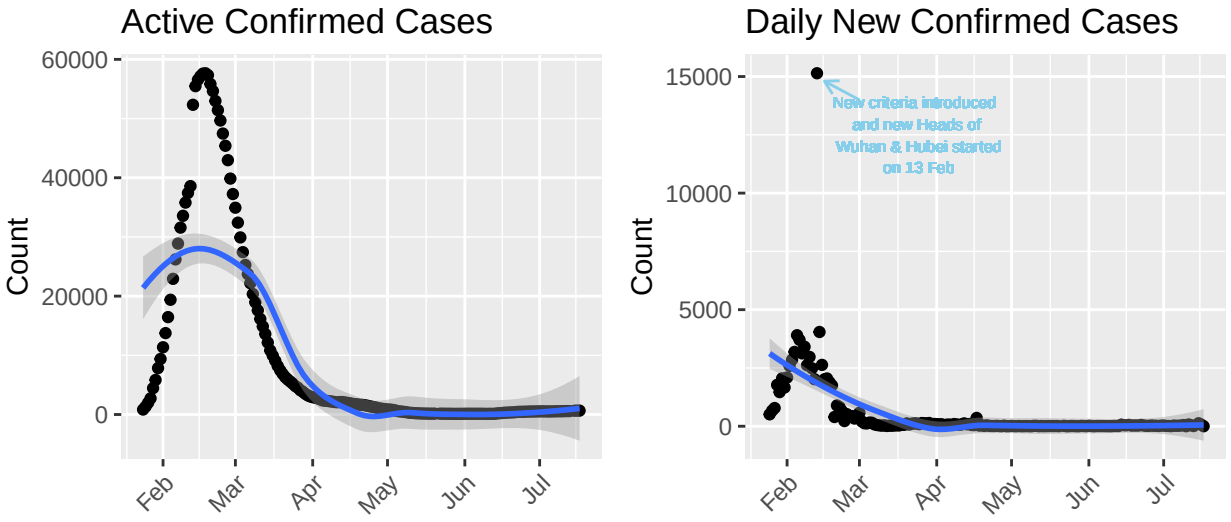

Figure 2: Active Confirmed Cases

4.3 Deaths and Cured Cases

In the bottom-left chart of Figure 3, there is a big spike of 1,290 new deaths on 17 April 2020. The explanation given by Chinese govenment is that it is caused by a rectification of previously missed deaths.

```
## a scatter plot with a smoothed line and vertical x-axis labels
plot1 <- ggplot(data, aes(x=date, y=deadCount)) +
  geom_point() + geom_smooth() +
  xlab('') + ylab('Count') + labs(title='Cumulative Deaths') +
  theme(axis.text.x = element_text(angle=45, hjust=1))
plot2 <- ggplot(data, aes(x=date, y=curedCount)) +
  geom_point() + geom_smooth() +
  xlab('') + ylab('Count') + labs(title='Cumulative Cured Cases') +
  theme(axis.text.x = element_text(angle=45, hjust=1))
plot3 <- ggplot(data, aes(x=date, y=new.dead))  +
  geom_point() + geom_smooth()  +
  xlab('') + ylab('Count') + labs(title='Daily New Deaths') +
  theme(axis.text.x = element_text(angle=45, hjust=1)) +
  annotate('segment', x=ymd('2020-04-02'), xend=ymd('2020-04-14'),
           y=1150, yend=1250, colour='skyblue', size=0.5,
           arrow=arrow(length=unit(0.2, 'cm'))) +
  geom_text(x=ymd('2020-03-15'), y=1130,
            label='Death toll rectified\n on 17 Apr',
            color='skyblue', size=2.5)
plot4 <- ggplot(data, aes(x=date, y=new.cured)) +
  geom_point() + geom_smooth()  +
  xlab('') + ylab('Count') + labs(title='Daily New Cured Cases') +
  theme(axis.text.x = element_text(angle=45, hjust=1))
## show four plots together, with 2 plots in each row
grid.arrange(plot1, plot2, plot3, plot4, nrow=2)
```

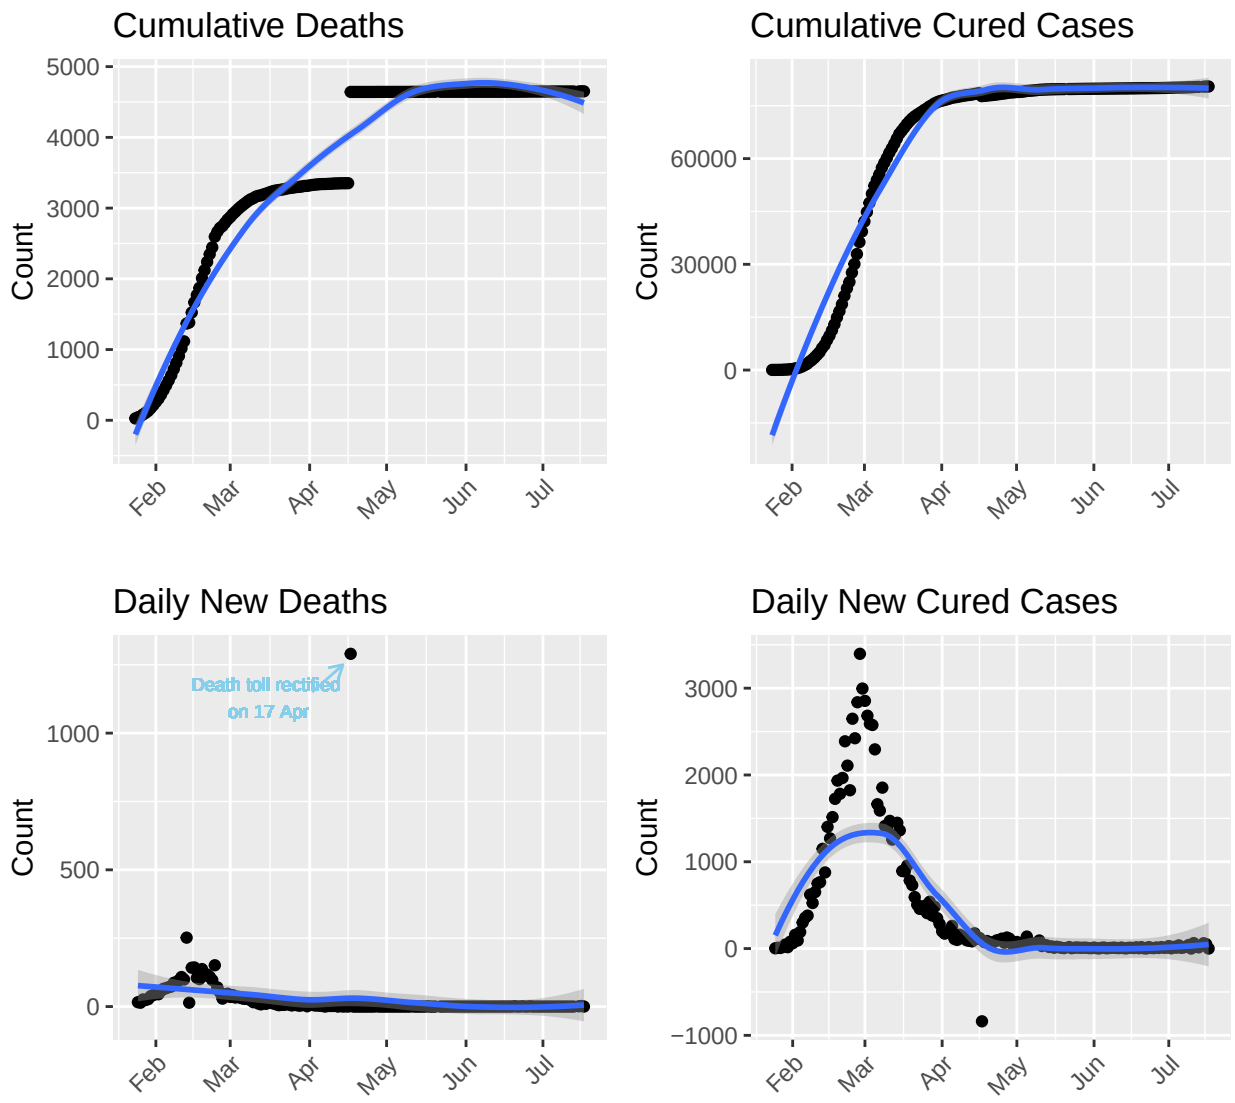

Figure 3: Deaths and Cured Cases

4.4 Death Rates

Figure 4 shows death rates caculated in three different ways (see Section 3.2 for details). The left chart shows the death rates from 24 January 2020 to 17 July 2020 and the right one is a zoom-in view of the rates in last two weeks.

In the right chart, the upper bound (in blue) is decreasing, as there will be more cured cases and fewer deaths daily as time goes on. However, the lower bound (in green) keeps going up, as there are and will be new deaths from the active confirmed cases. Therefore, the final death rate is expected to be in-between of those two rates, and based on the latest data as of 17 July 2020, it is be around 5.4% (see the last row in the table at the end of this report).

```
## three death rates
plot1 <- ggplot(data, aes(x=date)) +
  geom_line(aes(y=rate.upper, colour='Upper bound')) +
  geom_line(aes(y=rate.lower, colour='Lower bound')) +
  geom_line(aes(y=rate.daily, colour='Daily')) +
  xlab('') + ylab('Death Rate (%)') + labs(title='Overall') +
```

```
  theme(legend.position='bottom', legend.title=element_blank(),
        axis.text.x = element_text(angle=45, hjust=1)) +
  ylim(0, 100)
## focusing on last 2 weeks
plot2 <- ggplot(data[n-(14:0),], aes(x=date)) +
  geom_line(aes(y=rate.upper, colour='Upper bound')) +
  geom_line(aes(y=rate.lower, colour='Lower bound')) +
  geom_line(aes(y=rate.daily, colour='Daily')) +
  xlab('') + ylab('Death Rate (%)') + labs(title='Last two weeks') +
  theme(legend.position='bottom', legend.title=element_blank(),
        axis.text.x = element_text(angle=45, hjust=1)) +
  ylim(0, 8)
grid.arrange(plot1, plot2, ncol=2)
```

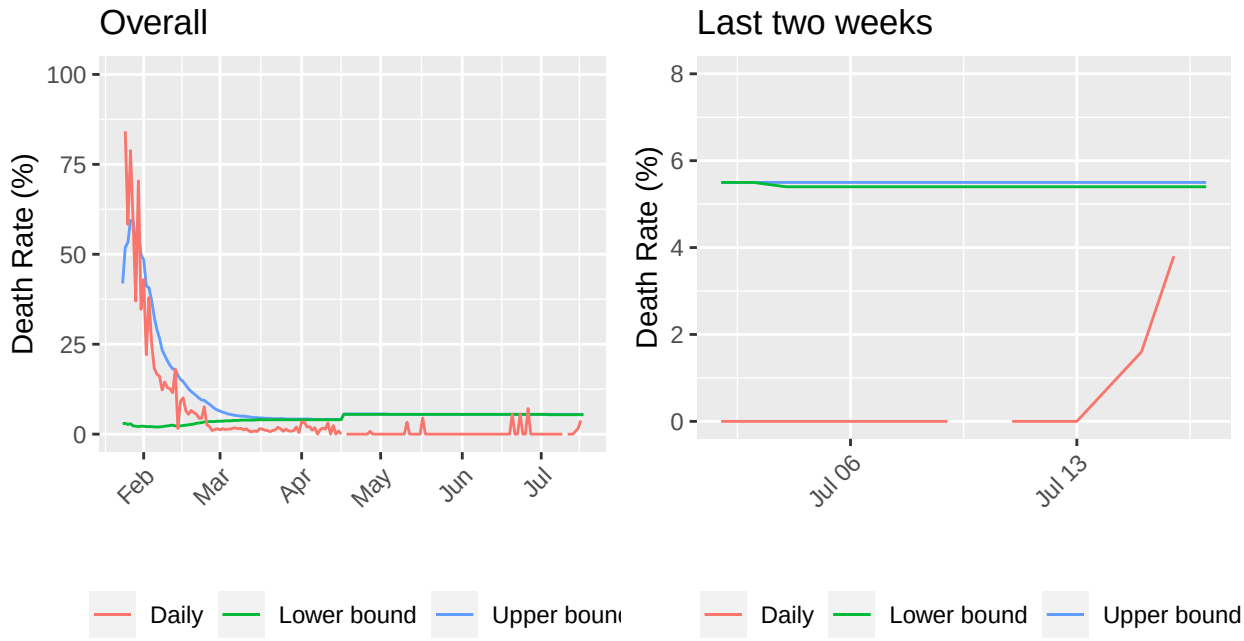

Figure 4: Death Rate

Appendix A. Processed Data

Blow is the processed data for this analysis and visualisation. Note that numbers in the first row of the table are subject to change, if they are about today (14 August 2020).

```
## sort by date descendingly and re-order columns
data %<>% arrange(desc(date)) %>%
  select(c(date, confirmedCount, deadCount, curedCount, currentConfirmedCount,
           new.confirmed, new.dead, new.cured, rate.upper, rate.daily, rate.lower))
## to make column names shorter for output purpose only
names(data) %<>% gsub(pattern='Count', replacement='')
## output as a table
## highlight two anomaly days, one with new.confirmed >= 10000 and the other with new.dead >= 1000
data %>%
  mutate(rate.upper = rate.upper %>% format(nsmall=1) %>% paste0('\\%'),
         rate.lower = rate.lower %>% format(nsmall=1) %>% paste0('\\%'),
```

```
        rate.daily = rate.daily %>% format(nsmall=1) %>% paste0('\\%')) %>%
