1 Introduction

This is a simple analysis of data around the Novel Coronavirus (COVID-19) in China, to demonstrate data processing and visualisation with R, *tidyverse* and *ggplot2*.

I have also produced a similar report for COVID-19 worldwide. If you are interested, please find it at $\label{eq:hatch} $$ http://www.rdatamining.com/docs/Coronavirus-data-analysis-world.pdf.$

 $^{^*}$ ©2020 Yanchang Zhao, R
DataMining.com.

1.1 Data Source

The data sourse used for this analysis is Ding Xiang Yuan¹, which provides the data around the Novel Coronavirus (COVID-19) in China. Specifically, the data was retrieved from the *COVID-19/2019-nCoV Time Series Infection Data Warehouse* repository on GitHub². Detailed descriptions of the data can be found at http://lab.isaaclin.cn/nCoV/en.

The data was collected from 24 January 2020, the second day of Wuhan lockdown.

1.2 R Packages

Blow is a list of R packages used for this analysis. Package magrittr is for pipe operations like %% and %<>% and lubridate is for date operations. Package tidyverse is a collection of R packages for data science, including dplyr and tidyr for data processing and ggplot2 for graphics. Package gridExtra is for arranging multiple grid-based plots on a page and kableExtra works together with kable() from knitr to build complex HTML or LaTeX tables.

```
library(magrittr)
library(lubridate)
library(tidyverse)
library(gridExtra)
library(kableExtra)
```

1.3 Notes

If you want to run the R scripts without using R Markdown, please remove all the kable related stuff when printing the data.

2 Loading Data

At first, the dataset, which is a CSV file, is downloaded and saved as a local file, and then it is loaded into R.

```
url <- 'https://raw.githubusercontent.com/BlankerL/DXY-COVID-19-Data/master/csv/DXYOverall.csv'
filename <- './data/DXYOverall.csv'
download.file(url, filename)
data.raw <- read.csv(filename)
# summary(data.raw)
# names(data.raw)</pre>
```

The data was last updated at 2020-05-25 13:55:08.

Then we select relevant columns and have a look at the first 30 rows.

3 Data Preparation

3.1 Selecting Last Record of Each Day

There are many records with different timestamps for every single day. For this analysis, we focuse on daily numbers and therefore keep only the last record on each day. To acheive that, we group dataset by date and then select the first record from each group (i.e., from each day).

```
## convert from character to date
data.raw %<>% mutate(date=date(updateTime))
## sort by timestamp
# data.raw %<>% arrange(updateTime)
## select the latest record on each day
data <- tbl_df(data.raw) %>%
    group_by(date) %>%
    top_n(1, updateTime)
## sort by date ascendingly and remove updateTime
data %<>% arrange(date) %>% select(-updateTime)

min.date <- min(data.raw$date)
max.date <- max(data.raw$date)
min.date.txt <- min.date %>% format('%d %B %Y')
max.date.txt <- max.date %>% format('%d %B %Y')
```

3.2 Daily New Cases and Death Rates

After that, the daily increases of death and cured cases and the death rates are calculated.

rate.upper is caculated with the total deaths and cured cases. It is the upper bound of death rate and the reasons are

1) there were much more deaths than cured cases when the coronavirus broke out and when it was not contained, and

2) the daily number of death will decrease and that of the cured will increase as it becomes contained and more effective measures and treatments are used.

rate.lower is caculated with total deaths and confirmed cases. It is a lower bound of death rate, because there are and will be new deaths from the current confirmed cases. The final death rate is expected to be in between of the above two rates.

rate.daily is caculated with the daily deaths and cured cases and therefore is more volatile than the above two. However, it can give us a clue of the current situlation: whether it is very serious or is getting better.

3.3 Data Imputation

Some rows of column *currentConfirmedCount* are not populated in the raw dataset and we impute it as below.

3.4 Data Discrepancy

There is discrepancy in the dataset, which is checked with code below. Please understand that some numbers are not 100% accurate.

```
## check for data discrepancy
data %<>% mutate(total = currentConfirmedCount + curedCount + deadCount)
data %<>% mutate(error.dead = new.dead - deadIncr,
                 error.cured = new.cured - curedIncr,
                 error.total = total - confirmedCount)
data$error.dead %>% summary()
             1st Qu.
                                         3rd Qu.
                                                               NA's
       Min.
                       Median
                                   Mean
                                                     Max.
               0.000
## -108.000
                        0.000
                                 -1.241
                                           0.000
                                                    1.000
                                                                 10
data$error.cured %>% summary()
##
      Min. 1st Qu. Median
                              Mean 3rd Qu.
                                               Max.
                                                       NA's
## -569.00 -180.25 -45.50 -115.12 -14.75
                                               3.00
                                                         10
data$error.total %>% summary()
##
      Min. 1st Qu. Median
                              Mean 3rd Qu.
                                               Max.
```

```
## 0 0 0 0 0 0 0 # head(data %>% as.data.frame())
```

Since today's cured and death counts are subject to change and will not be finalised until end of today, we might want to exclude today's rates and new cases from some plots in next section.

```
# data %<>% arrange(date)
# if(data$date[n] == today()) {
# data$rate.daily[n] <- NA
# data$new.dead[n] <- NA
# data$new.cured[n] <- NA
# data$new.confirmed[n] <- NA
# }</pre>
```

4 Visualisation

After tidying up the data, we visualise it with various charts.

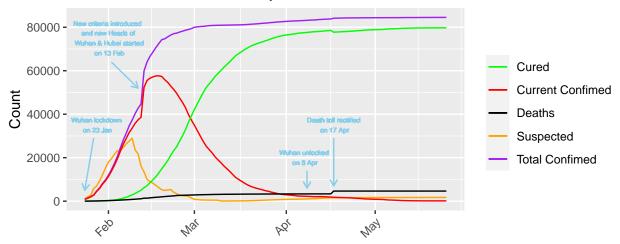

4.1 Number of Cases

Figure 1 shows the number of COVID-19 cases in China. The line and area plots show the numbers of dead, cured, current confirmed and suppected cases. Note that, in the area plot, the total number of confirmed cases is represented by the total areas of confirmed, cured and deaths.

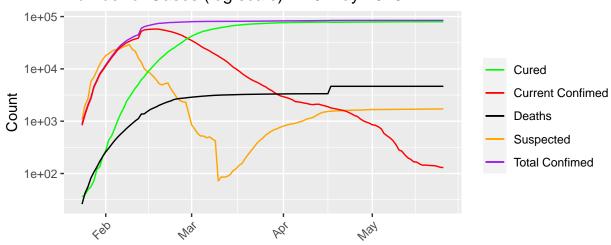

```
# total/current confirmed cases
p <- ggplot(data, aes(x=date)) +</pre>
  geom_line(aes(y=suspectedCount, color='Suspected')) +
  geom line(aes(y=confirmedCount, color='Total Confimed')) +
  geom_line(aes(y=currentConfirmedCount, color='Current Confimed')) +
  geom_line(aes(y=curedCount, color='Cured')) +
  geom_line(aes(y=deadCount, color='Deaths')) +
  xlab('') + ylab('Count') +
  theme(legend.title=element_blank(), axis.text.x = element_text(angle=45, hjust=1)) +
  scale_color_manual(values = c(
    'Suspected' = 'orange',
    'Total Confimed' = 'purple',
    'Current Confimed' = 'red',
    'Cured' = 'green',
    'Deaths' = 'black'))
## draw a plot and add annotations
plot1 <- p + labs(title=paste0('Number of Cases - ', max.date.txt)) +</pre>
  annotate('segment', x=ymd('2020-01-27'), xend=ymd('2020-01-24'),
           y=29000, yend=5000, colour='skyblue', size=0.5,
           arrow=arrow(length=unit(0.2, 'cm'))) +
  geom_text(x=ymd('2020-01-28'), y=35000,
            label='Wuhan lockdown\n on 23 Jan',
            color='skyblue', size=1.8) +
  annotate('segment', x=ymd('2020-02-02'), xend=ymd('2020-02-11'),
           y=64000, yend=52000, colour='skyblue', size=0.5,
           arrow=arrow(length=unit(0.2, 'cm'))) +
  geom_text(x=ymd('2020-02-01'), y=75000,
            label='New criteria introduced \n and new Heads of \n Wuhan & Hubei started\n on 13 Feb',
            color='skyblue', size=1.8) +
```

```
annotate('segment', x=ymd('2020-04-08'), xend=ymd('2020-04-08'),
           y=14000, yend=6000, colour='skyblue', size=0.5,
           arrow=arrow(length=unit(0.2, 'cm'))) +
  geom_text(x=ymd('2020-04-07'), y=20000,
            label='Wuhan unlocked\n on 8 Apr',
            color='skyblue', size=1.8) +
  annotate('segment', x=ymd('2020-04-17'), xend=ymd('2020-04-17'),
           y=29000, yend=7000, colour='skyblue', size=0.5,
           arrow=arrow(length=unit(0.2, 'cm'))) +
  geom_text(x=ymd('2020-04-17'), y=35000,
           label='Death toll rectified\n on 17 Apr',
            color='skyblue', size=1.8)
plot2 <- p + scale_y_continuous(trans='log10') +</pre>
  labs(title=paste0('Number of Cases (log scale) - ', max.date.txt))
## convert from wide to long format, for purpose of drawing an area plot
data.long <- data %>% select(c(date, suspectedCount,
                               currentConfirmedCount, curedCount, deadCount)) %>%
 rename(Suspected=suspectedCount, Confimed=currentConfirmedCount,
         Cured=curedCount, Deaths=deadCount) %>%
 gather(key=type, value=count, -date)
## set factor levels to show them in a desirable order
data.long %<>% mutate(type = factor(type, c('Suspected', 'Confimed', 'Cured', 'Deaths')))
## area plot
plot3 <- ggplot(data.long, aes(x=date, y=count, fill=type)) +</pre>
  geom area(alpha=0.5) + xlab('') + ylab('Count') +
  labs(title=paste0('COVID-19 in China - ', max.date.txt)) +
 theme(legend.title=element_blank(), axis.text.x = element_text(angle=45, hjust=1)) +
  scale_fill_manual(values=c('orange', 'red', 'green', 'black'))
## show three plots together
grid.arrange(plot1, plot2, plot3, ncol=1)
```

Number of Cases - 25 May 2020

Number of Cases (log scale) – 25 May 2020

COVID-19 in China - 25 May 2020

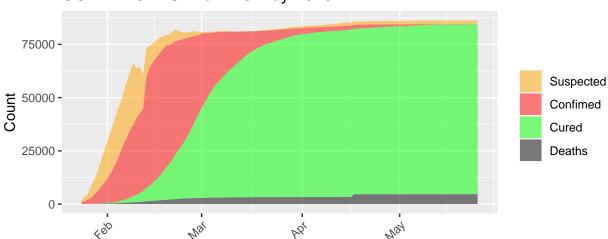

Figure 1: Numbers of COVID-19 Cases

Figure 1 (based on official stats) shows that the coronavirus seems to be contained in China, in that

- there are a lot of recovered cases (in green) every day,
- the remaining confrimed cases (in red) are shrinking significantly, and
- suspected cases (in orange) are almost gone.

4.2 Current (or Remaining) Confirmed Cases

In the right chart of Figure 2, there is a big spike of more than 15,000 new confirmed cases on 13 February 2020. The reasons are that Chinese government changed the criteria for confirmed cases and new measures were introduced by a new Head of Hubei Province and a new Head of Wuhan City, who replaced their predecessors on that day.

```
## current confirmed and its increase
plot1 <- ggplot(data, aes(x=date, y=currentConfirmedCount)) +</pre>
  geom_point() + geom_smooth() +
  xlab('') + ylab('Count') + labs(title='Current Confirmed Cases') +
  theme(axis.text.x = element_text(angle=45, hjust=1))
plot2 <- ggplot(data, aes(x=date, y=new.confirmed)) +</pre>
  geom_point() + geom_smooth() +
  xlab('') + ylab('Count') + labs(title='Daily New Confirmed Cases') +
  theme(axis.text.x = element_text(angle=45, hjust=1)) +
  annotate('segment', x=ymd('2020-03-01'), xend=ymd('2020-02-16'),
           y=14000, yend=14800, colour='skyblue', size=0.5,
           arrow=arrow(length=unit(0.2, 'cm'))) +
  geom text(x=ymd('2020-03-24'), y=12500,
            label='New criteria introduced \n and new Heads of \n Wuhan & Hubei started\n on 13 Feb',
            color='skyblue', size=2)
grid.arrange(plot1, plot2, ncol=2)
```

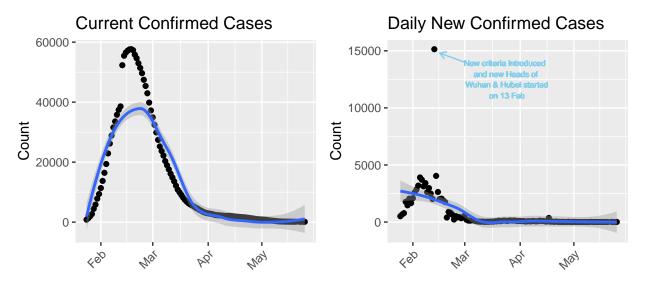

Figure 2: Current (or Remaining) Confirmed Cases

4.3 Deaths and Cured Cases

In the bottom-left chart of Figure 3, there is a big spike of 1,290 new deaths on 17 April 2020. The explanation given by Chinese government is that it is caused by a rectification of previously missed deaths.

```
## a scatter plot with a smoothed line and vertical x-axis labels
plot1 <- ggplot(data, aes(x=date, y=deadCount)) +</pre>
  geom point() + geom smooth() +
  xlab('') + ylab('Count') + labs(title='Cumulative Deaths') +
  theme(axis.text.x = element_text(angle=45, hjust=1))
plot2 <- ggplot(data, aes(x=date, y=curedCount)) +</pre>
  geom_point() + geom_smooth() +
  xlab('') + ylab('Count') + labs(title='Cumulative Cured Cases') +
  theme(axis.text.x = element_text(angle=45, hjust=1))
plot3 <- ggplot(data, aes(x=date, y=new.dead)) +</pre>
  geom_point() + geom_smooth() +
  xlab('') + ylab('Count') + labs(title='Daily New Deaths') +
  theme(axis.text.x = element_text(angle=45, hjust=1)) +
  annotate('segment', x=ymd('2020-04-02'), xend=ymd('2020-04-14'),
           y=1150, yend=1250, colour='skyblue', size=0.5,
           arrow=arrow(length=unit(0.2, 'cm'))) +
  geom_text(x=ymd('2020-03-15'), y=1130,
            label='Death toll rectified\n on 17 Apr',
            color='skyblue', size=2.5)
plot4 <- ggplot(data, aes(x=date, y=new.cured)) +</pre>
  geom_point() + geom_smooth() +
  xlab('') + ylab('Count') + labs(title='Daily New Cured Cases') +
  theme(axis.text.x = element_text(angle=45, hjust=1))
## show four plots together, with 2 plots in each row
grid.arrange(plot1, plot2, plot3, plot4, nrow=2)
```

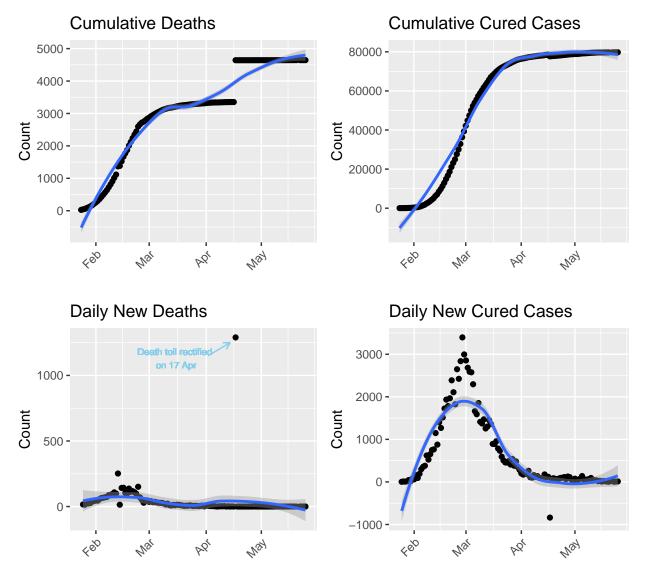

Figure 3: Deaths and Cured Cases

4.4 Death Rates

Figure 4 shows death rates caculated in three different ways (see Section 3.2 for details). The left chart shows the death rates from 24 January 2020 to 25 May 2020 and the right one is a zoom-in view of the rates in last two weeks.

In the right chart, the upper bound (in blue) is decreasing, as there will be more cured cases and fewer deaths daily as time goes on. However, the lower bound (in green) keeps going up, as there are and will be new deaths from the current confirmed cases. Therefore, the final death rate is expected to be in-between of those two rates, and based on the latest data as of 25 May 2020, it will be around 5.5% (see the last row in the table at the end of this report).

```
## three death rates
plot1 <- ggplot(data, aes(x=date)) +
   geom_line(aes(y=rate.upper, colour='Upper bound')) +
   geom_line(aes(y=rate.lower, colour='Lower bound')) +
   geom_line(aes(y=rate.daily, colour='Daily')) +
   xlab('') + ylab('Death Rate (%)') + labs(title='Overall') +</pre>
```

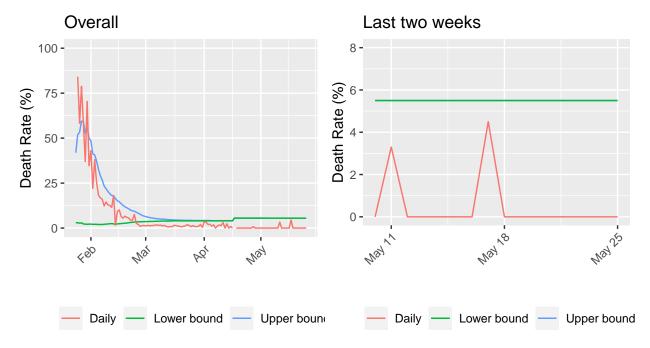

Figure 4: Death Rate

Appendix A. Processed Data

Blow is the processed data for this analysis and visualisation. Note that numbers in the first row of the table are subject to change, if they are about today (25 May 2020).

```
rate.daily = rate.daily %>% format(nsmall=1) %>% paste0('\\%')) %>%
mutate(new.confirmed=ifelse(!is.na(new.confirmed) & new.confirmed >= 10000,
                            cell_spec(format(new.confirmed, big.mark=','),
                                      "latex", color="red", bold=T),
                            cell_spec(format(new.confirmed, big.mark=','),
                                      "latex", color="black", bold=F)),
       new.dead=ifelse(!is.na(new.dead) & new.dead >= 1000,
                            cell_spec(format(new.dead, big.mark=','),
                                      "latex", color="red", bold=T),
                            cell_spec(format(new.dead, big.mark=','),
                                      "latex", color="black", bold=F))
       ) %>%
